The topic of Photoshop and all of its features is so vast and complex that this article only touches on the highlights of Photoshop's unique features. For a comprehensive overview of all of Photoshop's features, please refer to an online Photoshop tutorial. In this article, Photoshop's layers are used as an example to show how you can easily move and manipulate images. Moving and Mapping Photoshop layers are the basis of its multi-track editing system. Layers allow you to easily add and manipulate images, such as objects, pictures, text, and shapes. Layers are the default state of an image. When you open any image in Photoshop, layers are created automatically. Your object can be placed in any layer. Adobe recommends that layers be created at the beginning stages of your project. To place an object on a layer, simply drag the object onto the layer. To move an object to a new location on the same layer, click the object and hold down the Shift key on your keyboard, or you can click and drag the object. Image To move an image to a new location on the same layer, click the "move" tool (the arrow tool) on your toolbar and drag the image to a new location. When you have finished, click the "stop" tool (the paintbrush tool) and paint over the image to "lock" the new position on the layer. You can also move objects between layers. To do this, click the layer that the object is on, click the "move" tool on your toolbar, and drag the object to a new location. To move the layer containing your object to a new location, double click on the layer to bring up the Layer Properties dialog box. Find the "Lock" property under the "layer" column. Click "lock" or "unlock" to move the layer. Image Mapping To map an image, select one or more layers, right-click on a layer, click the "Map" option, and choose "New Mapping". You will see a map tool with a single square as the canvas. You can drag the square to a new location and the new image will be placed on the selected layers. At any time, you can click the "draw a selection" tool to add a selection to your image (visible only in the Layers window). Mapping allows

This article summarizes recent studies in healthy elderly adults evaluating safety and tolerability of live attenuated influenza vaccine (LAIV), which requires two doses separated by approximately 6 weeks. In clinical trials, LAIV was well tolerated, with similar rates of systemic adverse reactions (fever, fatigue, headache, myalgia, gastrointestinal symptoms, and cough) among vaccine recipients in the United States and Europe. There was no evidence of greater reactogenicity or acceptability in the elderly. Influenza-like illnesses, which are more common in the elderly, were not increased by LAIV.
